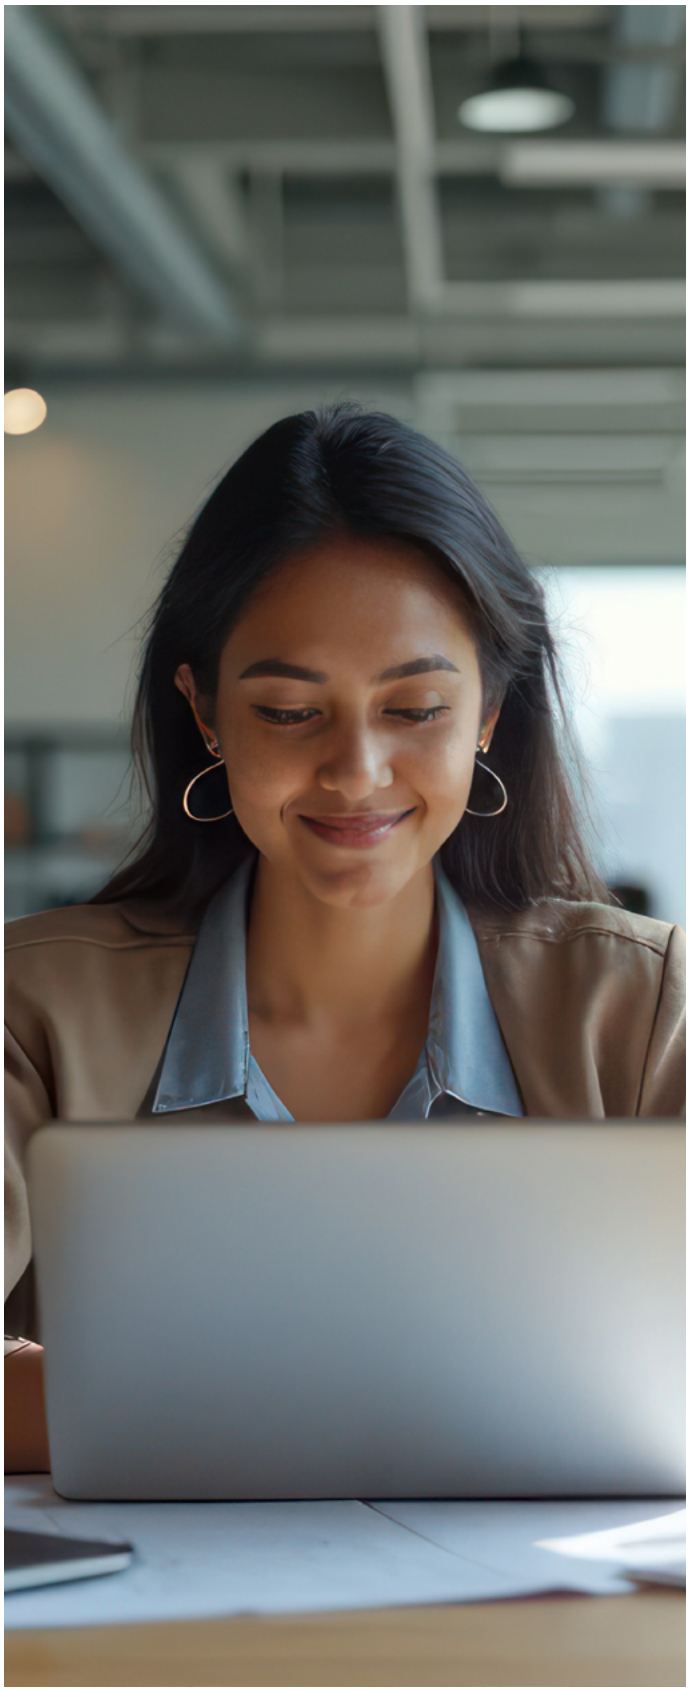
9 SAP Cloud ERP primarily supports finance processes.

10 A stronger supply chain foundation for growing companies

11 Let's build what's next—together

Misperceptions are holding supply chains back



Supply chains move fast, and outdated assumptions can move even faster. Many leaders believe AI-enabled supply chain capabilities are built only for large enterprises, too complex to adopt, or too costly for a growing company.

SAP Cloud ERP changes that equation by bringing AI, connected data, and proven supply chain processes within reach for companies of every size and industry. Growing companies can get started quickly and add capabilities as priorities evolve.

Embedded AI draws on business context—from inventory and capacity to orders, suppliers, shipments, and costs—to help teams identify issues sooner and align planning with execution. As operations become more complex, assistants and agents can manage routine work within clear guardrails, helping teams respond faster while remaining in control.

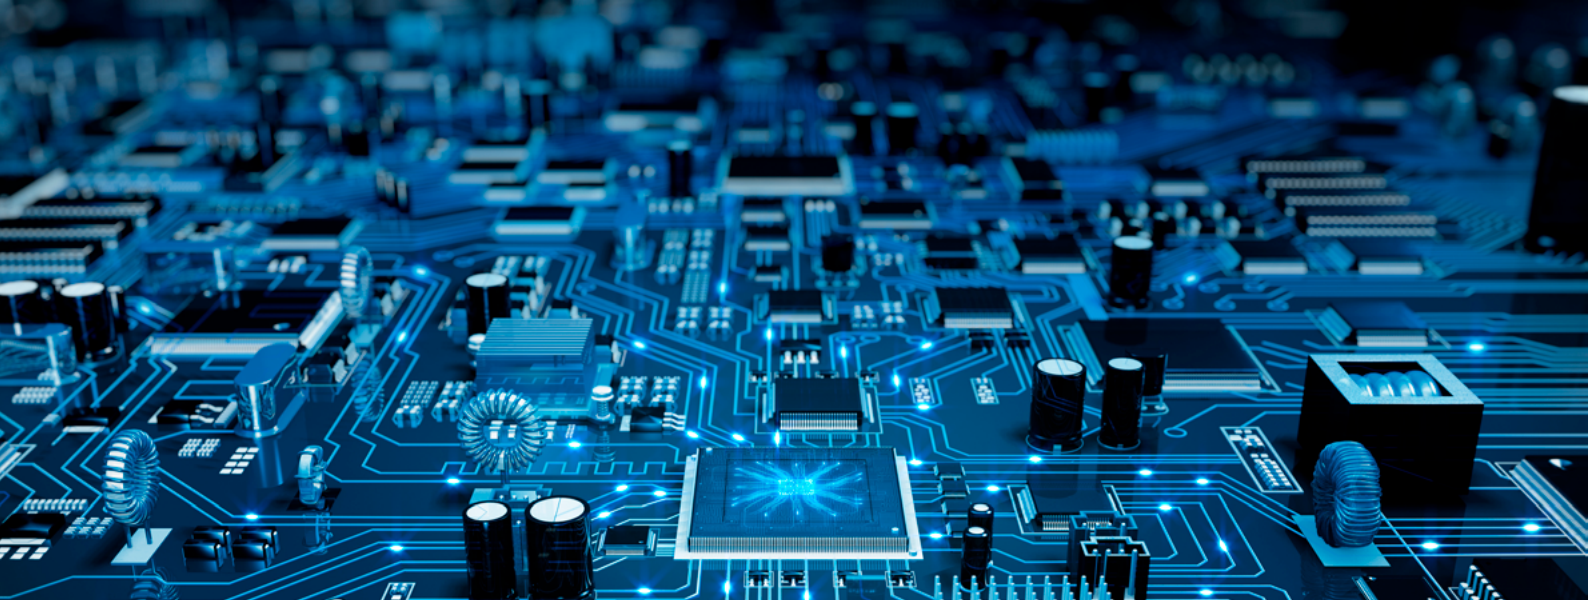
The following myths reveal what SAP Cloud ERP can offer supply chain leaders and what becomes possible when operations are connected.

Only

15%

of supply chain organizations worldwide have AI and execution-ready data foundations.

Source: "The AI-Ready Data Imperative," Zero100, 2026.



Myth 1

The deployment of SAP Cloud ERP takes too long and is complicated.

Supply chain conditions can change overnight, making a long, resource-heavy ERP project difficult to justify. Traditional implementations may have earned that reputation, but SAP Cloud ERP offers a different path.

With SAP GROW offerings, growing companies can bypass the typical six- to nine-month timeline. A structured approach, built on preconfigured templates for core cloud ERP and supply chain processes, creates a clear route to go live in weeks, not quarters.

Supply chain organizations can begin with the capabilities they need most, connect operational decisions with finance, and add more as operations evolve. This shortens the ROI cycle and helps the business realize value sooner.

Preconfigured industry best practices, guided setup tools, and proven methodologies simplify each stage of implementation. Built-in automation streamlines configuration, testing, and data migration, while SAP's partner ecosystem provides added expertise and support.

wefabricate

Wefabricate

Wefabricate B.V. needed to replace disconnected ERP systems that limited visibility, warehousing, and growth. With expert support, the industrial manufacturer deployed SAP Cloud ERP in just 10 weeks, proving modernization does not have to become a lengthy, complex project. It gained integrated warehouse management, better logistics control, complete insight into production costs, stronger financial integration, and greater support for sustainability initiatives.

Together, these capabilities make deployment smoother and more predictable, giving supply chain teams a faster route to connected, responsive operations.

PureTech Scientific

PureTech Scientific

PureTech Scientific LLC adopted SAP Cloud ERP with just 50 employees and no internal IT team. Built-in best practices helped establish core operations, while real-time analytics now provide visibility into cash flow, supply chain activity, and daily production. More important, the specialty chemicals company gained enterprise-grade insight and scalability without requiring enterprise-sized internal resources.

Myth 2

SAP Cloud ERP is too expensive and built only for big companies.

Enterprise-grade supply chain capabilities may seem reserved for global companies with deep pockets and large IT teams. SAP Cloud ERP challenges both assumptions head-on.

Its modular architecture, flexible pricing, and predefined scope let growing companies begin with the supply chain capabilities they need now. Built-in industry best practices and ready-to-use templates reduce costly customization, while transparent pricing helps prevent budget surprises.

As priorities evolve, companies can add capabilities across planning, manufacturing, logistics, and asset operations without taking on enterprise-level complexity.

Approximately 80% of SAP customers are small and midsize businesses.[1]

Value begins with a faster, on-budget go-live and builds through everyday operations. Connected processes and data can reduce manual work, improve inventory and cash-flow visibility, and coordinate planning with execution.

Real-time analytics make results visible and measurable, while automation helps teams respond faster and improve efficiency over time. The system supports current priorities and accommodates more processes as the business grows.

Myth 3

SAP Cloud ERP requires heavy customization to integrate with existing platforms.

Few supply chains run on a single system. Over time, planning, manufacturing, logistics, asset operations, and partner networks accumulate their own applications and data.

SAP Cloud ERP supports current supply chain operations while leaving room to connect new capabilities as needs change.

Designed for scalability, extensibility, and integration, the AI-powered cloud ERP can connect with SAP and third-party applications, tools, platforms, and systems. This allows data and decisions to move across the supply chain without rebuilding every process.

The addition of SAP GROW provides preconfigured industry best practices that help teams get started quickly with less effort. Standard APIs and extensions simplify integration while keeping core features and functionality standardized.

SAFRAN

Safran Blades

Safran Blades integrated SAP Cloud ERP with Belgium's PEPPOL e-invoicing network and its existing manufacturing execution system. Even with both integrations, the manufacturer went live in under five months. SAP best practices and minimal customization helped create compliant, connected operations with real-time production feedback, consistent data, and room to scale.

Read the customer story

This clean, connected foundation also gives AI the business context to understand how changes in demand, inventory, capacity, suppliers, shipments, and costs affect one another.

Myth 4

SAP Cloud ERP is not meant for growing companies like mine.

SAP Cloud ERP is built for growing businesses, not just large enterprises. As demand rises, operations expand, and partner networks become more complex, it provides the flexibility, speed, and scalability small and midsize companies need.

These are not slimmed-down capabilities. Growing companies gain affordability and agility, together with the reliable, connected data and proven processes trusted by global leaders. That combination helps them keep pace with higher volumes, broader networks, and new opportunities.

With SAP GROW, supply chain teams can go live quickly with a predefined scope of core functionality. Companies can connect supply chain decisions with finance, then add planning, manufacturing, logistics, and asset operations as priorities change.

Built-in best practices reflect decades of industry experience, helping teams manage real-world constraints such as inventory, capacity, sequencing, fulfillment, and compliance. Predictable subscription pricing, simplified updates, and partner-led deployment reduce complexity and IT burden.

ASCEND ELEMENTS

Ascend Elements

Ascend Elements' rapid growth outpaced its legacy systems, leaving logistics and finance disconnected. With SAP Cloud ERP, the battery materials innovator gained one source of truth, real-time production and inventory data, and freedom from duplicate data entry. Inventory location accuracy also improved by 15%, creating a stronger foundation for continued expansion.

Myth 5

SAP Cloud ERP is not a good fit for our industry.

SAP Cloud ERP is built for the way businesses operate, not for generic use. It combines preconfigured best practices and data models tailored to more than 25 industries, including manufacturing, retail, professional services, and wholesale distribution.

That industry depth matters because every supply chain works within distinct constraints. Capacity, shelf life, production sequencing, quality, traceability, and regulatory requirements all shape decisions from planning through execution.

SAP Cloud ERP brings this industry context into connected processes across planning, manufacturing, logistics, asset operations, and finance. Companies gain relevant capabilities from day one, with flexibility as customer expectations, regulations, and operating requirements change.

Embedded analytics provide real-time insight into inventory, production, fulfillment, and cost. Built-in compliance and governance keep decisions aligned with industry regulations and policies. AI draws on the same trusted context to understand operational consequences, recommend relevant actions, and help coordinate the response.

ETHealthcare

ET Healthcare

At ET Healthcare Technology (Suzhou) Co., rapid product innovation drove a 40% surge in shipments and greater supply chain complexity. The life sciences equipment provider used SAP Cloud ERP to connect warehouse shipping, invoicing, accounting, and cost tracking and support market segmentation and regulatory requirements. Now, it has the real-time, traceable information necessary to keep operations moving at the pace of growth.

The Western Sugar Cooperative

Western Sugar

Western Sugar Cooperative needed to rethink supplier invoice processing as tight margins made accurate, timely payments critical for growers and suppliers. With SAP Cloud ERP and the SAP Ariba Invoicing solution, the cooperative automated approximately 40,000 supplier invoices and cut processing time by 25%. It also improved accuracy and compliance, freeing finance teams to focus on improvements that benefit growers and the business.

Read the customer story

Myth 6

SAP Cloud ERP primarily supports finance processes.

FUWO

Guangdong FUWO Intelligent Manufacturing Co. Ltd. (FUWO) needed to modernize operations as growing order volumes and global expansion put pressure on its supply chain. With SAP Cloud ERP, the manufacturer connected planning, production, materials management, sales, and finance while streamlining processes from production to delivery. The result is 30% more-accurate material-demand forecasting, 25% greater production scheduling efficiency, and a 15% increase in on-time delivery.

Read the customer story

Finance may be where many companies first encounter ERP, but it is only part of the picture. SAP Cloud ERP also supports the supply chain processes that turn plans into products and customer commitments into deliveries.

Built-in capabilities coordinate demand and supply, help ensure supply coverage, and support production scheduling and execution. Real-time insights give teams a clear view of inventory, capacity, orders, costs, and performance so they can make informed decisions and track the effects across the business.

For more specialized needs, supply chain planning solutions can strengthen forecasting, while manufacturing execution systems automate shop-floor operations and connect machines and sensors. Linking these processes with finance reveals what operational events mean for costs, margins, and cash flow.

Together, these capabilities connect planning, execution, and finance, helping teams make faster decisions with a clearer view of business performance.

A stronger supply chain foundation for growing companies

SAP is a proven partner for growing companies, trusted by thousands worldwide to help them scale efficiently and adapt over time. Across their operations, businesses use SAP solutions to simplify work, automate critical processes, and sustain growth without unnecessary complexity.

The modularity of SAP Cloud ERP and the speed and predictability of SAP GROW allow supply chain organizations to focus first on the problems creating the most friction. Connected processes across manufacturing, logistics, asset operations, and finance create room for new capabilities, broader networks, and changing business models.

Continuous innovation across cloud, data, and AI helps teams anticipate disruption, gain insights faster, and coordinate decisions across the supply chain. Assistants and agents can handle routine work within clear guardrails, leaving people to focus on priorities, exceptions, and strategic decisions.

Built-in security, compliance, governance, and reliability give growing companies the control to respond to change without putting operations at risk.

Nearly

~80%

of SAP customers are small and midsize businesses.

Let’s build what’s next—together

You’ve heard the myths. Now, see the reality.

SAP Cloud ERP, paired with SAP GROW, gives growing companies a predictable way to get started quickly and scale as needed. A defined core ERP scope, guided implementation, and built-in supply chain best practices speed deployment and support long-term growth.

Through a unified core, trusted business data, built-in AI, proven industry practices, and continuous innovation, SAP Cloud ERP connects finance with planning, manufacturing, logistics, and asset operations. This shared context helps teams spot disruptions sooner, gauge the business impact, and coordinate planning with execution.

Rather than stitching solutions together or pausing growth for system changes, companies gain integrated cloud capabilities that adapt with their operations. As connected data, embedded intelligence, assistants, and agents support more processes, supply chains can anticipate disruption, coordinate action, and respond in real time.

Momentum favors companies prepared for what comes next. SAP Cloud ERP and SAP GROW help supply chain leaders build more agile, resilient operations and advance toward greater autonomy at a pace that fits the business.

SAP Grow Fast with TCT

A friction free path to cloud ERP; AI-driven execution, expertise that advises not follows, clear ROI.
